Introduction to Logbook

HTTP Request and Response Logging

- For debugging or audition a common use case is to log the HTTP Request and Response
  - This includes logging of the request headers and body
  - Details of what was sent in the HTTP payload can be very helpful
- Support for this varies depending on the HTTP library being used
- Spring has limited support, and typically cannot log the HTTP Body
- The majority of options do not have the ability to mask sensitive information written to logs

Zalando Logbook

- Zalando is a large European retailer head quartered in Germany
- Zalando Logbook is an open source HTTP Request and Response Logging Library
- Logbook supports all major Java servers and clients
- Logbook is a standardized way to log HTTP Requests and Responses including the HTTP Body

Zalando Logbook Features

- Sensible Defaults Out of the Box
  - Convenient Spring Boot Starter available
- Customization of logging format, destination, and conditions to log
- Ability to obfuscate sensitive data
- Integration with popular logging aggregators

Zalando Usage

- Add Spring Boot Starter to Project
  - Provides sensible defaults with auto configuration
- Enable tracing log level
- JSON Log Output
  - Using JSON log output is helpful for logging aggregators
  - Makes log searches much easier because data can indexed for searching
